# RESEARCH PHENOMENON & PROBLEM

## Fenomena

Pemerintah di berbagai belahan dunia berlomba membuka data pada berbagai bidang dan menyediakannya untuk publik di Internet (*open government data*). Siapa pun yang memiliki akses internet dapat mengunduh dan mengolah data untuk berbagai kepentingan.

## Permasalahan

Masyarakat bisa menggunakan data terbuka pemerintah untuk menjawab permasalahan sosial. Namun, apakah masyarakat termotivasi untuk melakukan hal tersebut? Apabila iya, apa yang memotivasi mereka, dan apa yang bisa pemerintah lakukan supaya masyarakat berpartisipasi?

## 7.3. Limitations and future research

As with any research, there are several limitations to note. First, the results may differ according to the scenario. In the present study, the scenarios were chosen in line with criteria from the literature, but the participants may have had different personal experiences leading to different results. Hence, other examples within the categories should be

tested to increase generalizability. Second, the results may be influenced by which level of government offers the services. Hence, trust in different governmental institutions should be included in future analyses. Third, despite a careful compilation based on the literature, essential reasons for or against acceptance may be missing from this analysis, and future studies should seek to identify and include these. Fourth, the empirical data were gathered from Australian citizens using an online platform leading to a bias of a lower mean age in the sample compared to the population, but still covering a wide age range. Additionally, the sample may not be representative of citizens of other countries. Hence, the study should be repeated in other countries. Fifth, the sample is relatively young and the self-assessment of experience with AI is relatively high. It could be that this is an unrepresentative, tech-savvy sample. Sixth, the scenarios have the same output regardless of whether the AI or the human is performing the service. It can be assumed that the AI will provide faster and possibly better service than humans could. Therefore, citizens may accept public services not because of AI but despite AI. Seventh, we have not investigated acceptance in the case of human–AI collaboration. This would make it possible to investigate different levels of automation. Eighth, we focused on AI-based software that performs the same activities as humans. However, AI-based software has the potential to deliver a range of public services, including some that do not yet exist, and future research should take account of these possibilities. Ninth, the AI-based software under study was presented in an embedded form. Different results might be obtained in connection with virtual or robotic AI-based software solutions, and future research should analyze these alternatives. In addition, no further explanation was given as to whether the software used was rule-based or data-driven. This can also have a major impact on decisions. Moreover, in order to our findings, the coefficient of determination for AI in specific services is  $R^2 = 0.450$  and for AI in general services is  $R^2 = 0.167$ , suggesting that there are other factors that influence adoption that we

have not looked at before. Further research is therefore essential to fill this knowledge gap. Furthermore, we have found that the adoption of AI in specific services can be increased if the co-determination and co-creation of individuals in (exceptional) requests is given. For this reason, deep research should take place on how these aspects can be implemented. Future research should consider the transparency of AI and individual requirements of society for AI in general services. Finally, although we focused here on citizens, other stakeholders in public services should be surveyed regarding their acceptance of AI. Services are conducted in co-creation, and thus it is important that all parties should accept the use of AI-based software.

## Artificial Intelligence and Business Value: a Literature Review

Ida Merete Enholm<sup>1</sup> · Emmanouil Papagiannidis<sup>1</sup> · Patrick Mikalef<sup>1</sup> · John Krogstie<sup>1</sup>

### 4 Synthesis of Literature Review

This section presents the findings from the systematic literature review, structured according to the thematic codes that emerged during the analysis of past studies. The findings were obtained through an analysis process following the research methodology. To be able to assess the body of knowledge on AI and business value, we differentiated between three inter-dependent levels, which are depicted in Fig. 2. In this organizational framework w

### 5 Research Agenda

factors relating to the aspects, and environmental impact on the ability of c

From the synthesis in Section 4, several research gaps are identified in relation to the study of AI use in organizations. Through challenging assumptions and identifying areas where there is a significant lack of knowledge, this section aims to provide a framework for guiding future research. The goal is not to present an exhaustive list of potential research directions, but rather, to highlight some important gaps in our understanding of how AI is shaping the way organizations are conducting business and competing. We therefore define five research themes, with each presenting a number of research directions (D) that can help expand our knowledge. The research framework is presented in Fig. 3, with the themes being represented in the enumerated circles.

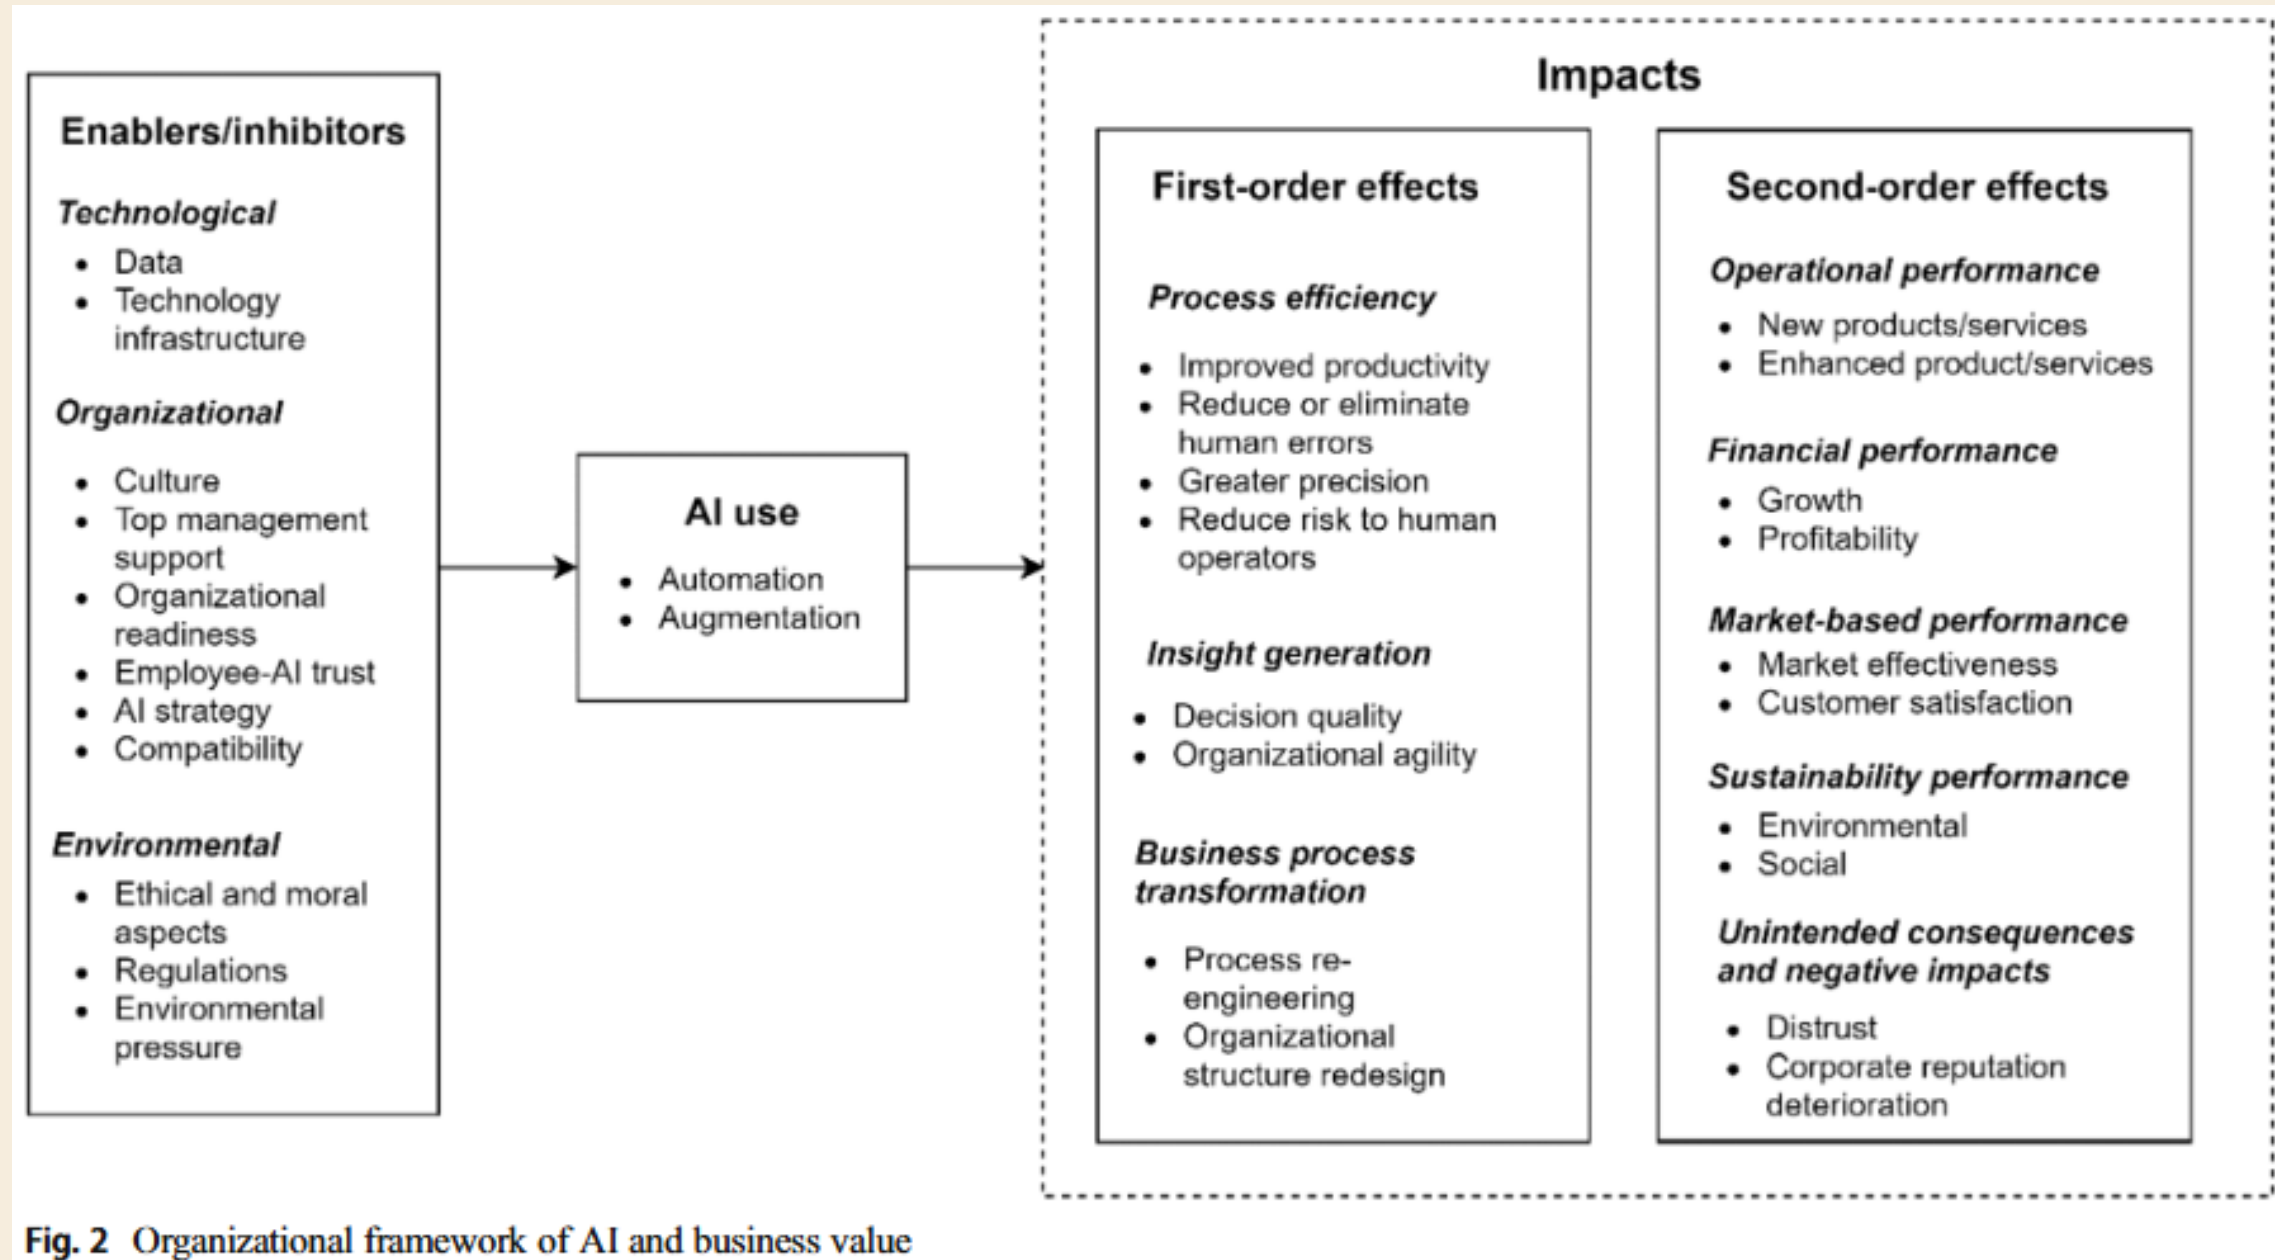

Fig. 2 Organizational framework of AI and business value

        - Ethnographic
          - Discourse Analysis

# METODOLOGI PENELITIAN

| Research Question  | Type of Question        | Recommended Method*                                   |
|--|-------------------------|---|
| What types of politically driven budget changes are made before elections?                           | Descriptive             | Qualitative (Content Analysis, Case Study)            |
| How do politically driven budgeting decisions affect the nature and frequency of BPK audit findings? | Causal/Explanatory      | Quantitative (Panel Data Regression)                  |
| Is there a link between election years and qualified/adverse audit opinions?                         | Relational              | Quantitative (Correlation/Regression Analysis)        |
| What are the implications of political budget cycles for fiscal accountability and transparency?     | Implication/ Perception | Mixed Methods (Quantitative + Qualitative Interviews) |

\*Research Methods will be another topic for next Study Buddy Program

# METODOLOGI PENELITIAN

RQ 1. What types of politically driven budget changes are made before elections?

Objective: to explore and interpret the forms, patterns, and meanings of **politically motivated budget changes** made by Indonesian local governments during election years, with a focus on **how traditional cultural values interact with modern public financial management standards**

## Cultural Crossvergence Theory:

- Local leaders are caught between global norms of transparency and accountability (driven by BPK audits, Ministry of Finance regulations, and international standards)
- And traditional-cultural expectations rooted in collectivism, reciprocity, patronage, and moral leadership obligations.

1. The question is **exploratory and descriptive**, aiming to understand patterns and meanings of budget changes, not to quantify causal effects.
2. Quantitative approaches may detect that changes occur, **but only qualitative inquiry can uncover why they occur** from the perspective of actors embedded in cultural systems. **Crossvergence theory** calls for understanding value systems, motivations, and lived meanings—aligned with an interpretivist paradigm.
3. Indonesian local governments operate within complex layers of local norms, institutional constraints, and political traditions. A qualitative case study allows in-depth exploration of these local dynamics and variations (Yin, 2018)

Justifications

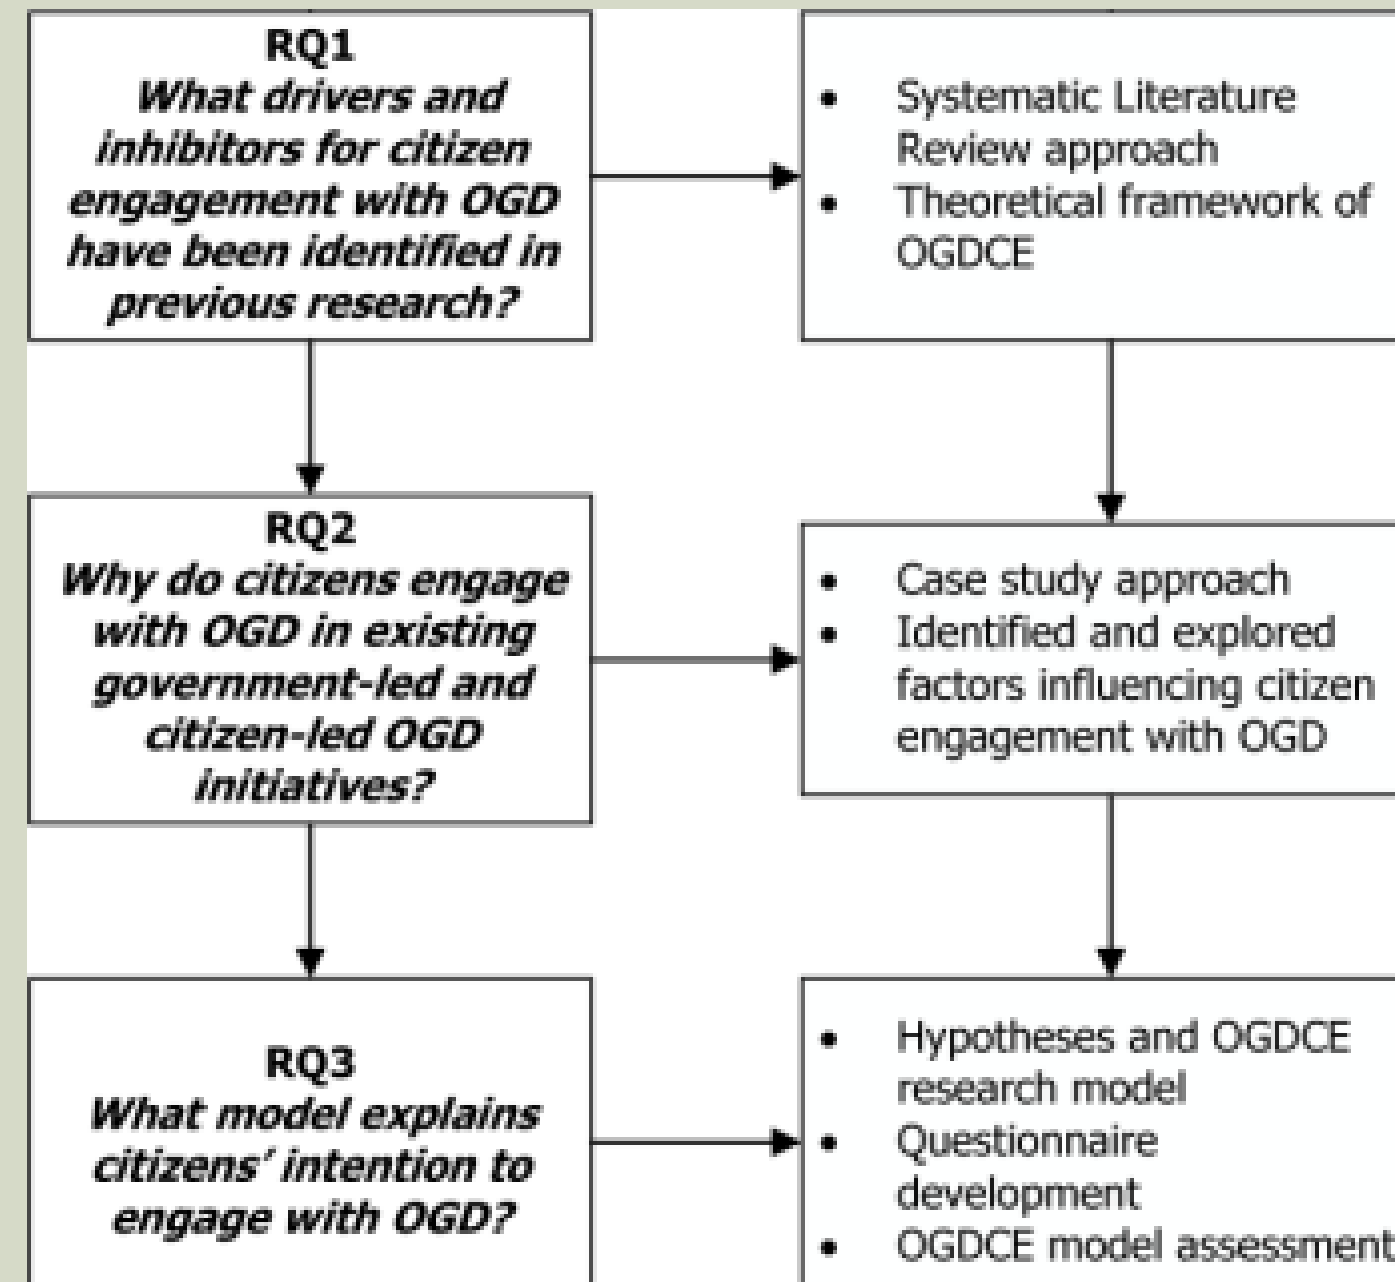

Approach : Qualitative, interpretive

Design: Multiple Case Studies/Comparative Case Study

Units of Analysis: Local government budgeting practices during the year before local elections

Tools: Semi-structured Interviews, Content & Thematic Analysis

# METODOLOGI PENELITIAN

# PARADIGMA

## 1.0 ONTOLOGY: What exists in the human world that we can acquire knowledge about?

## 2.0 EPISTEMOLOGY: How do we create knowledge?

## 3.0 THEORETICAL PERSPECTIVE: What is the philosophical orientation of the researcher that guides their action/research?

Knowledge acquisition is deductive, 'value-free', generalizable ← → Knowledge acquisition is inductive, value-laden, contextually unique

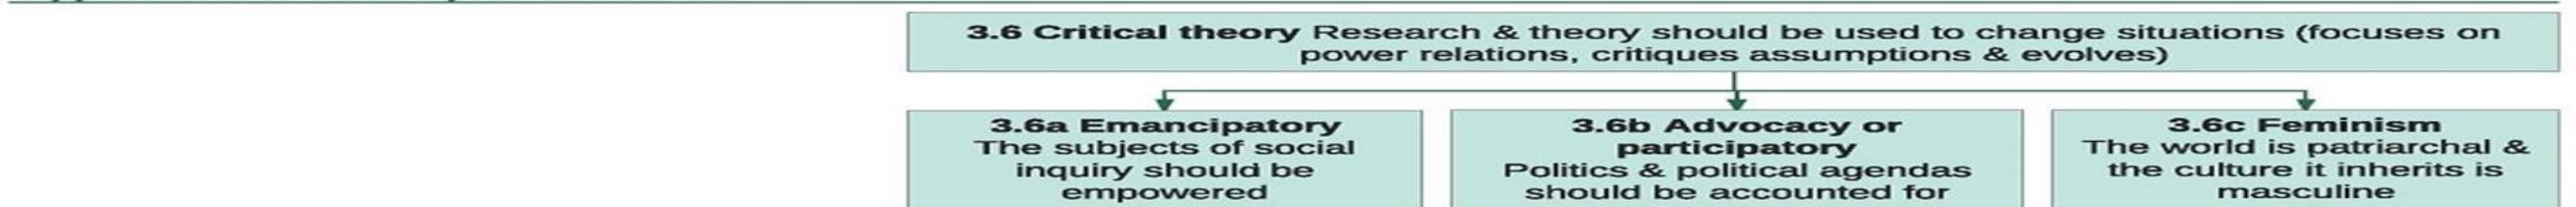

### Application: to predict

### Application: to understand

### Application: to emancipate or liberate

### Application: to deconstruct

### Application: any or all
